**IDENTIFICATION OF A PLATFORM FOR T CELL  
RECEPTOR RECOGNITION OF SPLICE  
VARIATION NEOANTIGENS IN GLIOBLASTOMA**

---

**Case: 2019-693**

# Robert Prins, Ph.D.

---

**Associate Professor, Department of  
Neurosurgery**

**Associate Professor, Department of Molecular  
and Medical Pharmacology**

Major research focus centers on understanding the immunology of malignant brain tumors and devising new immune-based therapies to treat these deadly tumors.

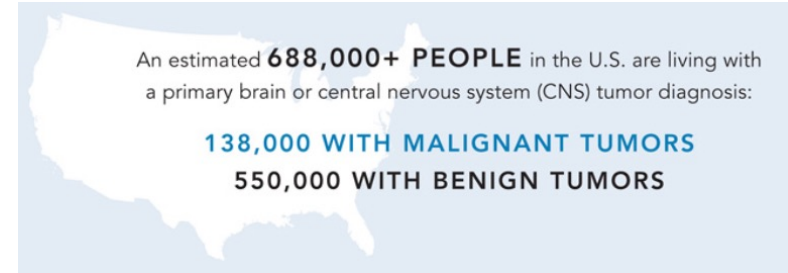

# Executive Summary

---

# High Level Overview

- Cancer is one of the most common diseases, globally, and is the second leading cause of death after cardiovascular diseases
- Immune cells called T cells recognize foreign protein fragments, called antigens, in order to elicit an immune response
  - Cancer cells produce alternatively spliced RNA, making peptide fragments unique to the cancer cells
  - These protein fragments, called neoantigens, are ideal immunotherapy targets because they are found only in cancer cells
- Knowledge of these alternative RNA splice variation allows for the development of immunotherapies and vaccines.

***No current technology can accurately predict and recognize splice variations unique to tumors.***

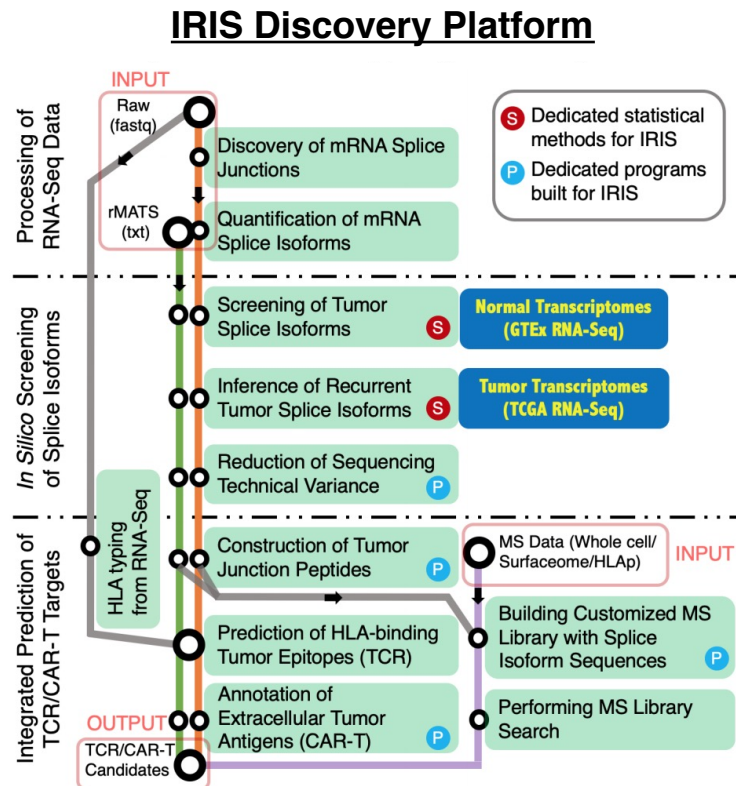

## Tumor Specific Antigen Recognition

# IRIS Innovates in Neoantigen Identification

- UCLA researchers have created a platform for the screening and identification of alternative mRNA splice variants unique to brain cancer
- This platform is called **IRIS**: Isoform peptides from RNA splicing for Immunotherapy target Screening
- IRIS is capable of screening multiple patient samples simultaneously in 'group mode' or can be performed in 'personalized mode' to identify targets for a specific patient sample
- IRIS predictions have been validated by tumor-infiltrating lymphocytes, which recognized the predicted splice variant peptides.

# Potential Applications of IRIS

## TCR and CAR-T therapies for cancer

## Neo-epitope peptide vaccines for the treatment of cancer

## Identification of novel splice-variants in disease

# IRIS Exhibits Considerable Advantages

IRIS utilizes neoantigens for immunotherapeutic targeting,  
reducing off-target toxicities

**Neoantigen Not Found  
in Healthy Cells**

- Reduced Toxicities
- Reduced Immune Tolerance

## Conserved Antigens

IRIS can be applied to group data or  
personalized data

# Developmental Timeline of Technology

## Aug. 2018: Initial Conception

IRIS pipeline developed  
for identifying  
neoantigens in brain  
cancer

7 of 8 candidates were recognized by human glioma patient T cells

Top candidate selected  
to determine patient  
clonotyping

Bioinformatics tools  
developed to identify  
cancer-specific splicing  
changes

22 glioma patient  
samples used to  
generate candidate  
epitope list

Summary					
RNA-Seq Processing	IRIS Screening & Selection		IRIS Translation	IRIS Prediction	
22 GBM RNA-Seq samples	Normal Brain	Tumor: GBM, LGG Normal: 11 more	Known ORFs in UniProtKB	TCR and CAR-T target prediction	
SE events	Primary	Prioritized	Junction peptides	TCR	CAR-T
190,232	6,276	<u>1,738</u>	5,423; <u>1,492</u>	4,153; <u>1,127</u>	416; <u>87</u>

Healthy patient T cells  
show very low  
recognition of epitopes

A few TCR clones  
dominate in recognition  
of the neoantigen

# Market Opportunity

---

# Market Overview: Global tumor-specific antigen market experiencing strong growth

BCC research report BIO184A

The global tumor-specific antigen market was \$1.8 billion in 2018.

- Projected growth to **\$2.4 billion by 2023.**
- Compound Annual Growth Rate (**CAGR**) of **6.2% by 2023.**

The mutated antigen market, which consists of neoantigen immunotherapies, shows the largest market area in North America.

- CAGR of mutated antigen market is 6.5%.
- High growth is expected across all regions.

# Competition in Glioblastoma Therapy

## Chemotherapeutics (Systemic Application)

## *Temozolomide*

***Nitrosourea***

## Disadvantages

Ototoxicity  
Cardiotoxicity  
Nephrotoxicity  
Haematological toxicity  
Gastrointestinal toxicity  
Hepatotoxicity  
Neurotoxicity

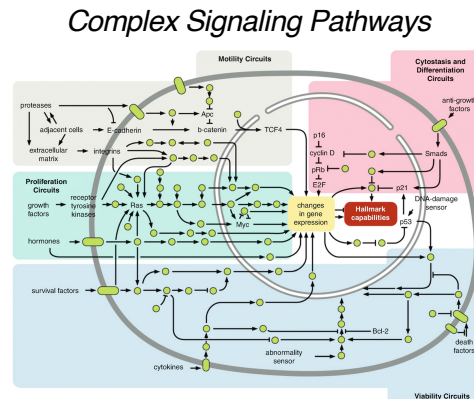

## Targeted Therapeutics (Signaling Pathways)

bevacizumab  
100 MG/4 ML INJECTION FOR IV USE

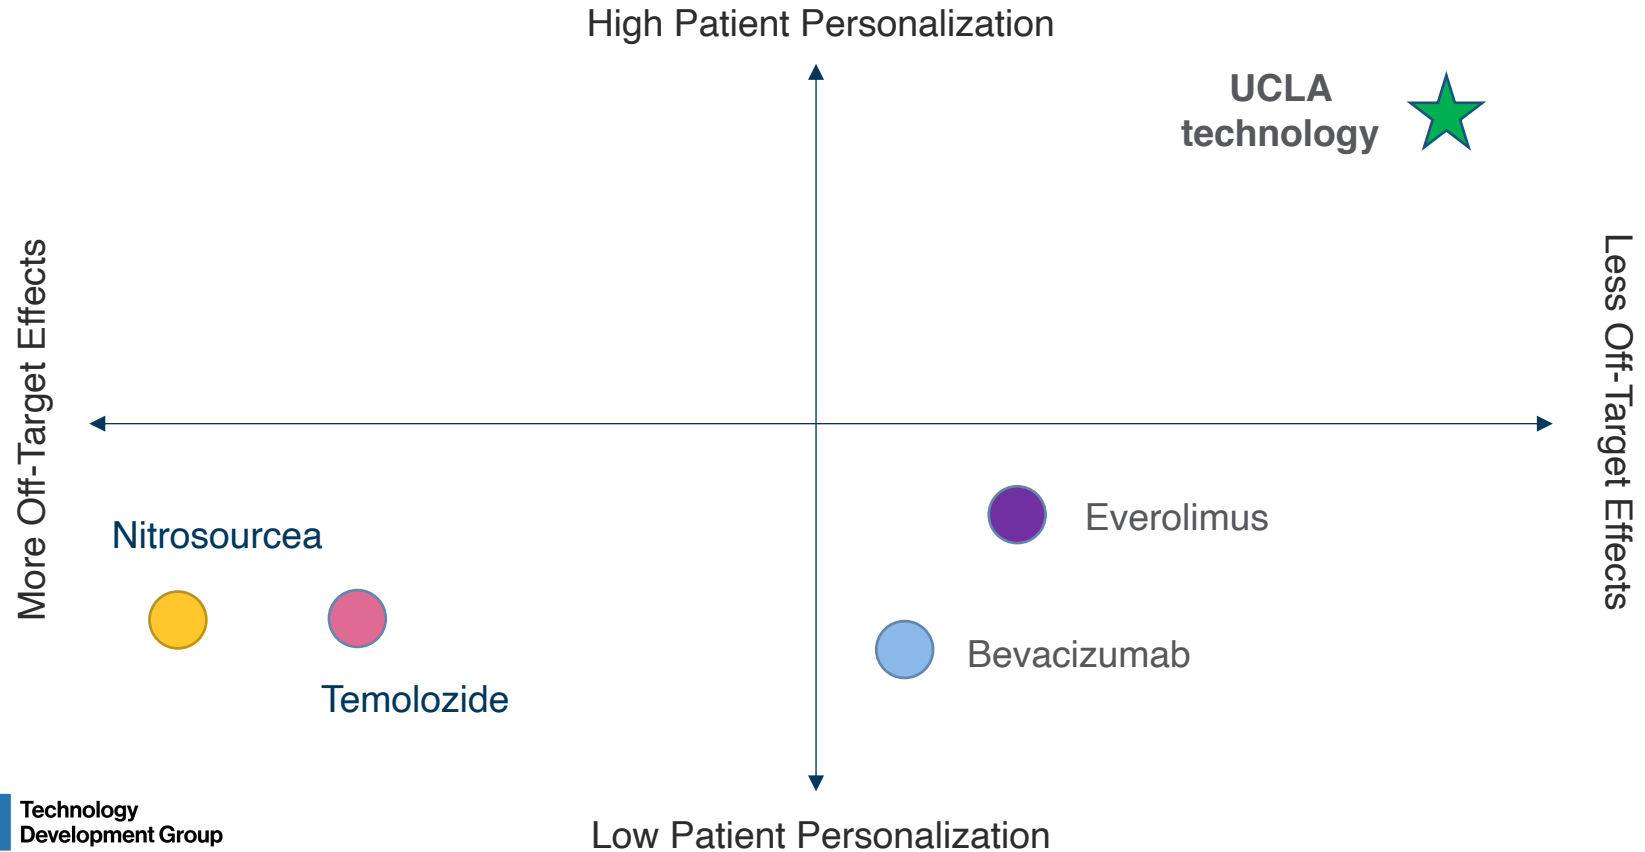

## *Everolimus*

## Disadvantages

**Many pathways overlap in healthy cells**

# Competition Analysis

# Market Stakeholder Profiles in Tumor-Specific Antigen Market

## Newly discovered neoantigens start to see interest

From analysis of news coverage from Nov 2013 – Oct 2018

Source: cbinsights.com

 CBINSIGHTS

Currently, neoantigen-based technologies are very new.

Major players in developing these therapies include:

- BioNTech
- Genentech
- Genocoea Biosciences
- Neon Therapeutics
- Gristone Oncology
- Agenus
- Adaptive Biotechnologies

# Commercialization Potential

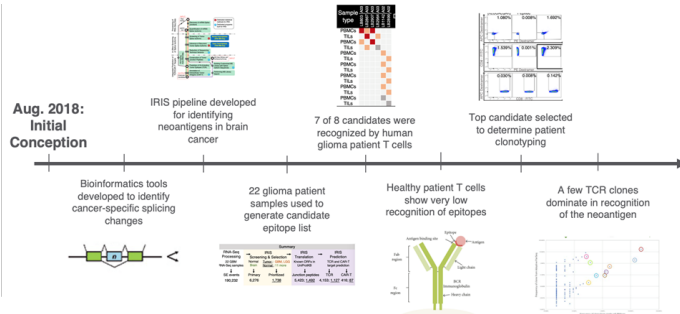

---

# Commercialization Potential

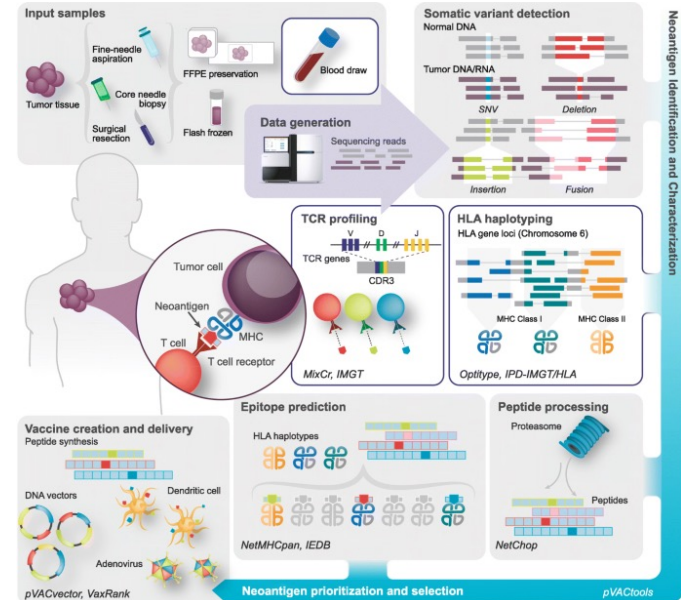

Neoantigens are being widely recognized as potential targets for next generation cancer therapeutics. However, current methods to identify neoantigens requires many patient samples, that are not readily accessible. Instead, IRIS allows minimal patient sample material, while providing accurate targets

**Methodology has been validated on clinical samples**

## Multiple Platforms for Neoantigen Discovery focus on common mutations

**IRIS gives the ability to identify neoantigens based on splice variants and has been used to develop a novel T Cell Receptor Therapy for Brain Cancer**
